What Is Colorectal Cancer?
Colorectal cancer is an uncontrolled growth of cells that originates in the colon or rectum.

Colorectal Cancer in the United States
- Colorectal cancer is the third most frequently diagnosed cancer in men and women.
- One in 17 men (5.9 percent) and one in 18 women (5.5 percent) will be diagnosed.
- Incidence and death rates have decreased over time (Figure 1).
- It is estimated that 106,000 colon cancer cases and 41,000 rectal cancers will be diagnosed in 2006.

Figure 1. Colorectal Cancer Rates, 1980-2002

Signs and Symptoms
Early colon cancer usually causes no symptoms and can be detected by available colorectal cancer screening tests. However, as colorectal cancer progresses, the disease may cause symptoms. People with the following symptoms should see their healthcare provider immediately:
- Change in bowel habits – such as diarrhea, constipation or narrowing of the stool – that lasts for more than a few days.
- Feeling that you need to have a bowel movement that doesn’t go away even after you do have a bowel movement.
- Bleeding from the rectum or blood in the stool.

Risk Factors
- Family history
- Ethnic background
- Previous colorectal cancer
- A history of polyps
- A history of bowel disease
- Cramping or gnawing stomach pain.
- Weakness and fatigue.

**Treatment**

The three main types of treatment for colorectal cancer are:
- Surgery
- Radiation therapy
- Chemotherapy

Depending on the stage of cancer, two or more types of treatment may be used at the same time, or one after the other.

**Survival Rates**

When colorectal cancer is diagnosed and treated at an early stage, nine out of 10 people live at least five years. However, if the cancer has spread to nearby organs or lymph nodes, the five-year survival rate drops substantially.

**Prevention**

Even though we don’t know exactly what causes colorectal cancer, there are some steps you can take to reduce your risk. Beginning at age 50, both men and women should discuss the full range of testing options with their health-care provider and choose one or more of the following testing options:
- Yearly fecal occult blood test.
- Flexible sigmoidoscopy every five years.
- Double-contrast barium enema every five years.
- Colonoscopy every 10 years.

**References**

The Center for Rural Health at the University of North Dakota School of Medicine and Health Sciences is assisting the North Dakota Department of Health in studying the burden of cancer upon North Dakotans. Results of this research are being used by the state Cancer Planning Committee to develop a plan for reducing the adverse impact of this disease on the lives and families of North Dakota residents.
