Rural and urban hospitals serve varied patient demographics. Urban hospitals are located in counties with 20% higher income than rural hospitals, and isolated rural hospitals provide care in counties where one-fifth of the population is elderly. As a result of patient demographics, reimbursement models, market characteristics, and available services (among other variables), rural hospitals are closing and rural communities are losing services in higher proportion than urban communities. The financial distress index (FDI) was developed to identify rural hospitals’ risk of financial distress and has been a useful tool in identifying at-risk hospitals, providing an opportunity for rural hospitals and communities to consider alternative service models. This research also opens the door to future study of policy options and the communities impacted by hospital closures.

**Hospitals in the United States**

In 2012-13, the U.S. had about 5,000 short-term, acute care hospitals; half were located in urban areas, and half were in rural areas. Among rural hospitals, 39% were located in large rural areas, 39% in small rural areas, and 22% in isolated rural areas. The largest number of hospitals were located in the South. See Figure 1.

**Figure 1. Number of Hospitals by U.S. Census Region and Rural/Urban Status (2012-13)**

Financial Distress Index

An FDI was developed to determine if a rural hospital could be classified at a high, medium-high, medium-low, or low risk of financial distress. The FDI model “includes 12 predictors composed of 4 measures of financial...”
performance, 2 measures of hospital characteristics, 2 measures of government reimbursement, 2 measures of community characteristics, and 2 measures of local competition.”

Between 2006 and 2014, hospitals identified as high risk in the FDI had closure rates 60 times higher than hospitals identified as low risk.

- Two out of three hospitals that closed were identified by the FDI at high risk of financial distress in the year prior to closure.
- The proportion of rural hospitals at high risk increased from 7.0% in 2015 to 8.1% in 2016.
- The South Census region reported the largest percentage of hospitals at risk in 2017.

States with the highest number of rural hospitals at high risk of financial distress in 2015 were Texas, Oklahoma, Tennessee, Arkansas, Georgia, and Alabama. States with the highest percentage of rural hospitals at high risk included Hawaii, Alabama, Oklahoma, Arkansas, and Tennessee. The South Census region reported a greater percentage of rural hospitals at high risk of financial distress than any other Census region. See Figure 3.

Urban and Rural Hospital Profitability

Insufficient revenue reduces hospital services and quality, which can lead to closure. Hospital closures leave rural residents at greater risk of health and economic hardships because of the loss of local acute and inpatient care services. Medicare Dependent Hospitals (MDHs) reported a larger percentage of their hospitals at high risk of financial distress than any other rural hospital type in 2016. However, the percentage of rural Perspective Payment System (PPS) hospitals and Rural Referral Centers (RRCs) at high risk consistently increased from 2013 through 2016. See Figure 4.

Figure 4. High Risk of Financial Distress in Rural Hospitals, by CMS Payment Type, 2013-2016

RRCs and urban hospitals had higher profitability when compared to other hospitals. The rural PPS hospitals (26-50 beds) and MDHs had lower profitability with high financial distress when compared to other payment systems. From 2012 through 2014, urban hospitals experienced increases in profitability while rural hospitals experienced decreases. For more basic information on these hospital types, visit www.ruralhealthinfo.org/topics/hospitals#designations.

States with the highest number of rural hospitals at high risk of financial distress in 2015 were Texas, Oklahoma, Tennessee, Arkansas, Georgia, and Alabama. States with the highest percentage of rural hospitals at high risk included Hawaii, Alabama, Oklahoma, Arkansas, and Tennessee. The South Census region reported a greater percentage of rural hospitals at high risk of financial distress than any other Census region. See Figure 3.
